The Interagency Conference on Research in the Watersheds (ICRW) brings together watershed scientists, stakeholders, and managers to share scientific advances and management strategies to sustain the country's water resources. The Conference highlights interdisciplinary research and synthesis on topics associated with watershed resilience, with a focus on solutions that integrate interacting environmental, social, economic, and political drivers of change.

ICRW7 – Enhancing Landscapes for Sustainable Intensification and Watershed Resiliency – offers a unique opportunity to engage with researchers from government, academic, non-profit, and community organizations working to protect, restore, and manage water resources at local to national scales. The 2020 conference theme promotes the organization of strong partnerships between watershed researchers and managers, and timely communication of relevant information on current issues in watershed science, for decision-making that is both informed and defensible. Contributions seeking science-based solutions to impacts of climate change, urbanization, and agricultural production in multifunctional watersheds are particularly welcome.

In addition to oral and poster sessions and pre-conference workshops, ICRW is committed to providing conference goers with first-hand experience of local research sites and regional landscapes via field trips, which are scheduled mid-week at no extra cost to participants.

We hope to see you in Tifton GA in 2020!
